

# CUTS

## Designer

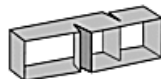

Philippe Nigro

## Technical characteristics

Thanks to the irregular shape of this module, one can obtain 4 different results simply by rotating the chests either horizontally or vertically. All that remains is to stack and/or juxtapose several such modules to obtain the desired configuration, a seemingly random construction. When stacked, chests are held in place by their own weight (28.6 lbs/13 kg) and steadied by small non-slip transparent rubber feet located between each chest. It is also possible to play with color by mixing the 5 finishes offered. Modules are made from satin lacquered MDF.
